SciVisum Launches Web Monitoring Service

Web application testing company SciVisum Ltd has announced a new web systems monitoring service that can be used to assess web site performance and ease of use.

The Sittingbourne, UK-based company's SV range of monitoring and functional test, transactional test, and stress test programs are intended to help web site administrators to measure and improve the performance and functionality of business-critical web-based applications.

The company said that over 80% of organizations it has surveyed rely mainly on customer complaints to detect problems with web sites and web-based applications. It said that a third of UK companies never monitor their web site performance.

SciVisum proposes that regular use of its test services will lead to measurably improved and more consistent web systems performance over time. SciVisum CEO, Deri Jones, was the founder of internet security testing company **NTA Monitor**, which he sold in 2002.
